Chapter 1 Safety

 Danger	 Attention
<ul style="list-style-type: none"> ·Only qualified personnel shall wire the drive, or it may cause electric shock. ·Perform the maintenance job after confirming that the charging LED is off or the DC Bus voltage is below 36V, or it may cause electric shock. ·Never wire the drive unless the input AC supply is totally disconnected, or it may cause electric shock. ·It is prohibited from changing internal parts or circuit. 	<ul style="list-style-type: none"> ·Don't install the drive in places where water pipes may leak onto it. ·Don't allow screws, washers and other metal foreign matters to fall inside the drive, otherwise there is a danger of fire or damage; ·Don't install the drive under direct sunshine, otherwise it may be damaged; ·Don't short circuit + and terminal (-), otherwise there is a danger of fire or the drive may be damaged. ·Don't apply supply voltage (AC 220V or higher) to control terminals except terminals Ra, Rb and Rc. ·PB and + are used to connect the brake resistor, do not shortcut them, or the brake unit may be damaged.

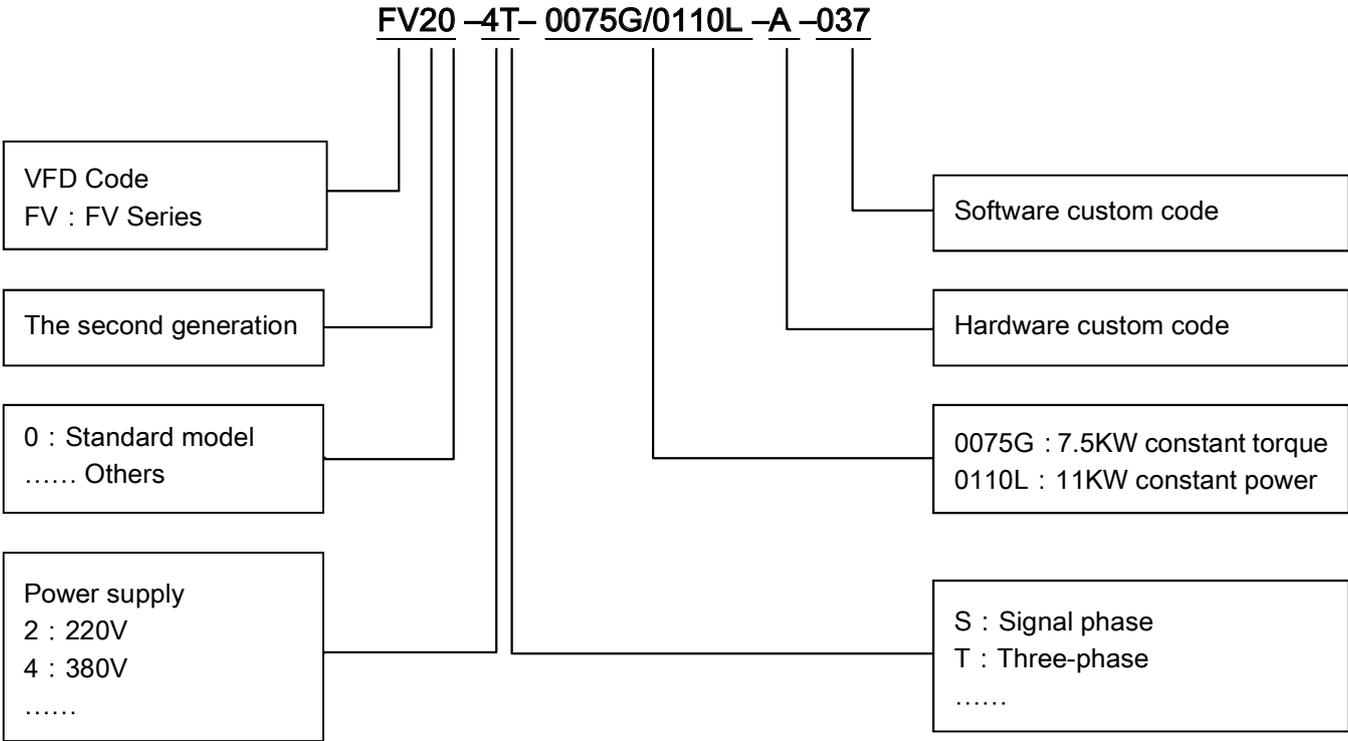

Chapter 2 Product introduction

In this chapter we introduce the basic product information of specifications, model, and structure and so on.

2.1 Nameplate Information

2.2 VFD Model Rule

2.3 External dimension and weight

2.3.1 External dimension and weight

2.3.2 Operation panel and installation box size

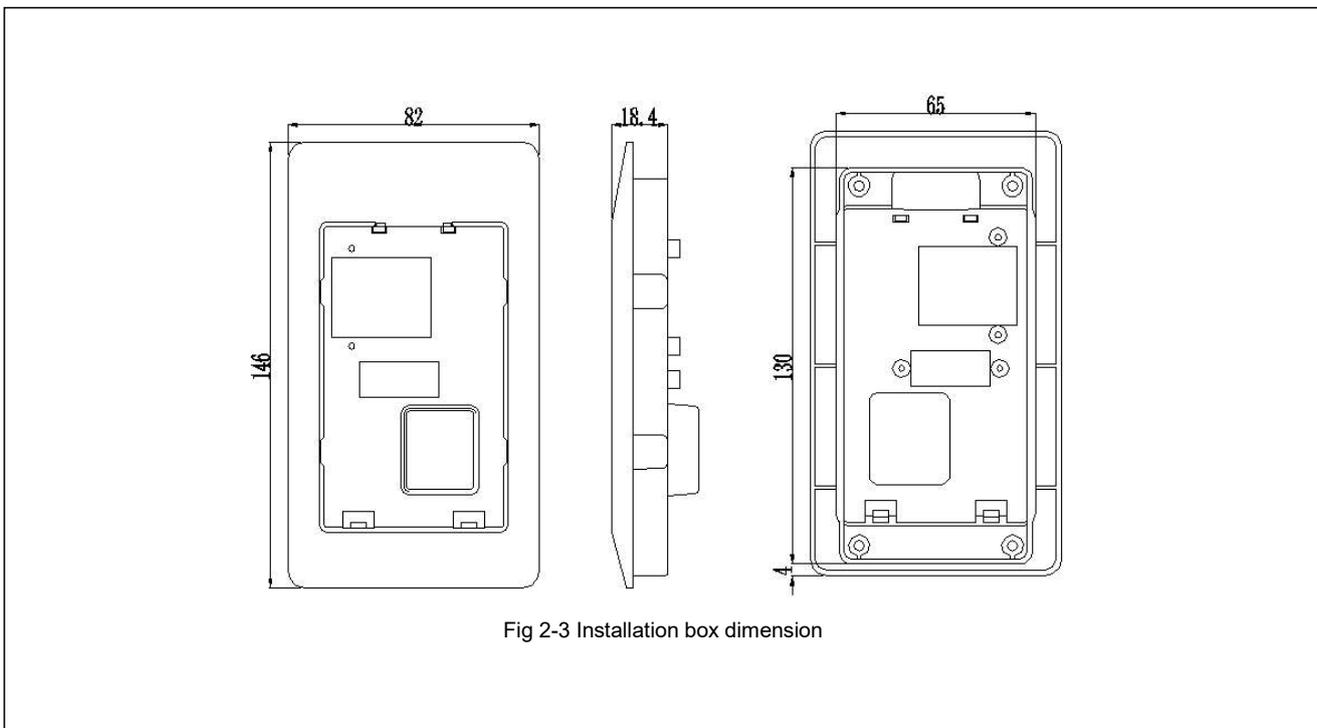

Fig 2-3 Installation box dimension

Note :

When the operation panel is mounted, the opening size of the tray is 65*130mm.

Chapter 3 Wiring Guide of VFD

3.1 Wiring and Configuration of Main circuit terminal

3.1.1 Terminal Type of Main Loop's Input and Output

Table 3-1 Description of main loop terminal

Terminal name	Function description
L、N	Single phase 220VAC input terminal
R、S、T	3-phase 380V AC input terminal
⊕、⊖	DC bus positive and negative terminal
⊕、PB	Braking resistor terminal
U、V、W	3-phase AC output terminal
PE	Shield PE terminal

3.1.2 Wiring of VFD for Basic Operation

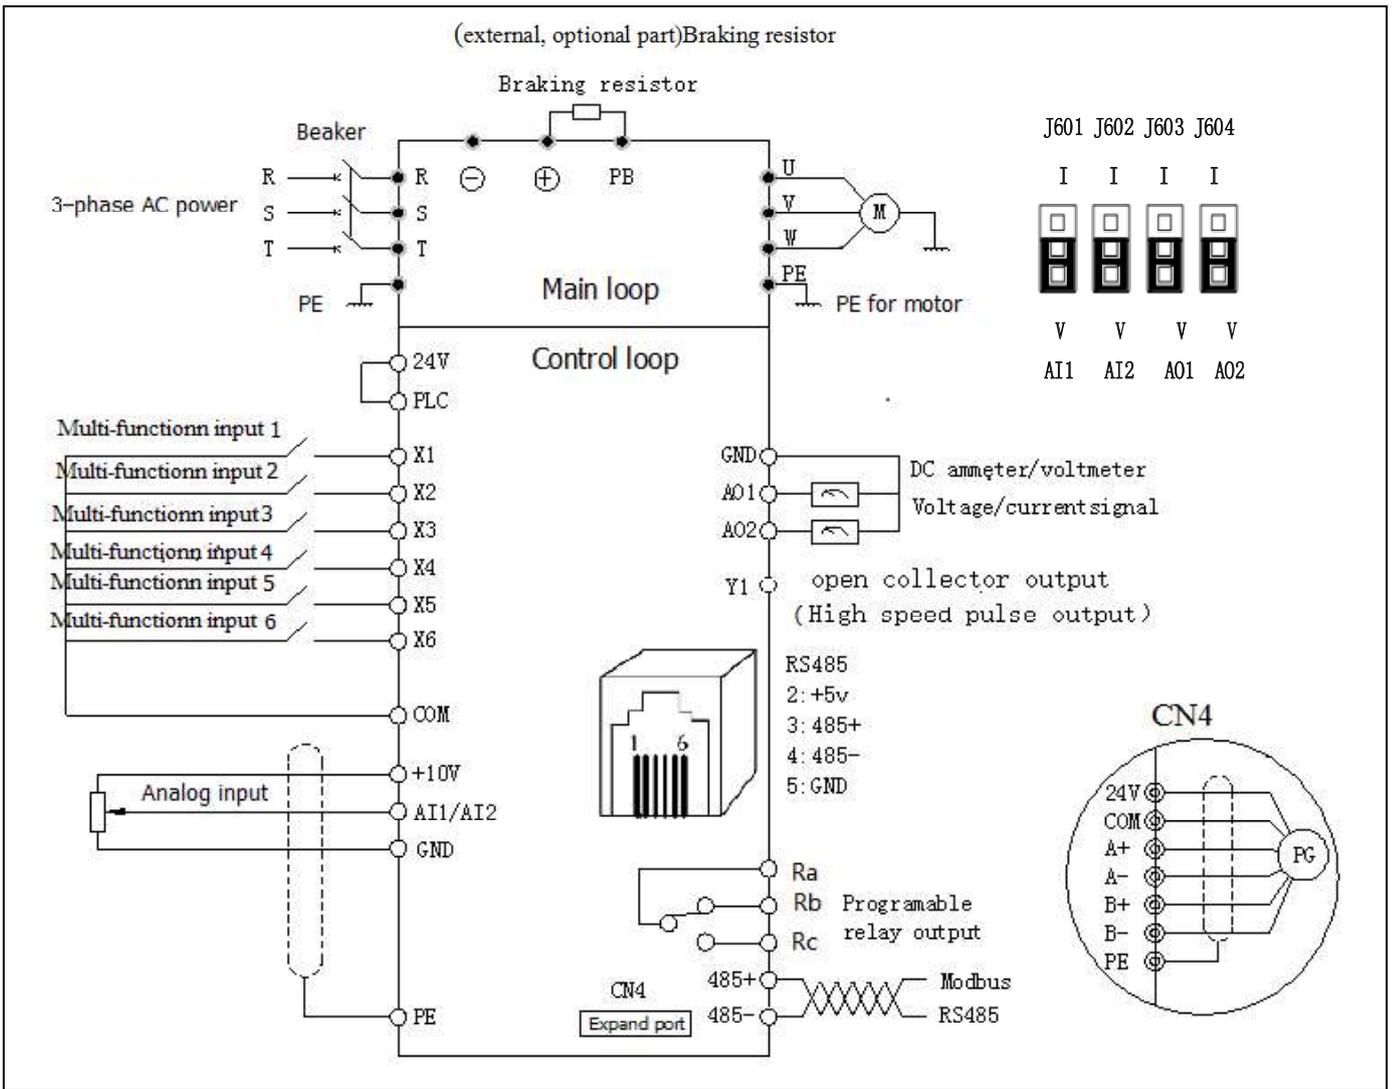

Fig.3-1 Basic wiring chart

3.2 Wiring and configuration of control circuit

3.2.1 Wiring of control circuit terminal.

Wire the terminals correctly before using the Drive. Refer to the table 3-2 for control circuit terminal function

Table 3-2 Control circuit terminal function

Sequence No.	Function
1	Analog input and output terminal, RS232 and RSR485 communication port

Note:

It is recommended to use cables bigger than 1mm² to connect to the terminals.

Arrangement of control circuit terminals is as follows.

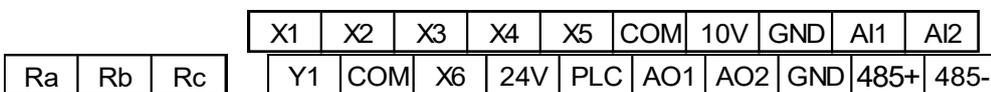

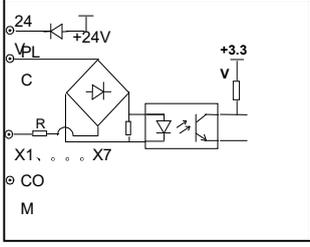

Fig.3-2 Arrangement of control terminals

Refer to table 3-3 for description of each terminal

Table 3-3 function list of each list

Category	Terminals	Name	Function description	Specification
Shield		Shielded PE	PE terminal connected to shielding layer. 485 communication cable, Analog signal cable, motor power cable shield can be connected to this terminal here	Connected to PE terminal of main loop inside
Power supply	+10	+10V Power supply	Provide +10V power supply	Maximum current output is 5mA
	GND	+10V GND of Power supply	GND for analog signal and 10V power supply	Isolated from COM and CME inside
Analog input	AI1	Signal-ended input AI1	Can accept analog voltage or current input, jumper AI1 can select voltage or current input mode.(Reference ground. GND)	Input voltage range.-10V ~ 10V(Input impedance 45Ω)Resolution 1/4000
	AI2	Signal-ended input AI2	Can accept analog voltage or current input, jumper AI2 can select voltage or current input mode.(Reference ground. GND)	Input current range.0mA ~ 20 mA,Resolution. 1/2000(Need jumper)
Analog output	AO1	Analog output 1	Providing analog voltage or current output, they are selected by the jumper AO1. The default setting is output voltage, refer to the function code A6.28 for detail.(Reference ground. GND)	Voltage output range.0V ~ 10V Current output range.0/4 ~ 20mA
	AO2	Analog output 2	Providing analog voltage or current output, they are selected by the jumper AO2. The default setting is output voltage, refer to the function code A6.29 for detail.(Reference ground.GND)	Voltage output range.0V ~ 10V Current output range.0/4 ~ 20mA
Communication	RS485+	RS485 communication port	485+	Standard RS-485 communication port, please use twisted-pair cable or shielded cable.
	RS485-		485-	
Multi-function input terminal	X1	Multi-function input terminal 1	Can be defined as multi-function digital input terminal. (Refer to the A6 group, form A6.00 to A6.06)	Optocoupler isolation input Input resist or. R=3.3kΩ Maximum frequency input of X1 ~ X5.200Hz  Maximum input frequency of X6.100kHz Input voltage range.2 ~ 30v
	X2	Multi-function input terminal 2		
	X3	Multi-function input terminal 3		
	X4	Multi-function input terminal 4		
	X5	Multi-function input terminal 5		
	X6	Multi-function input terminal 6		

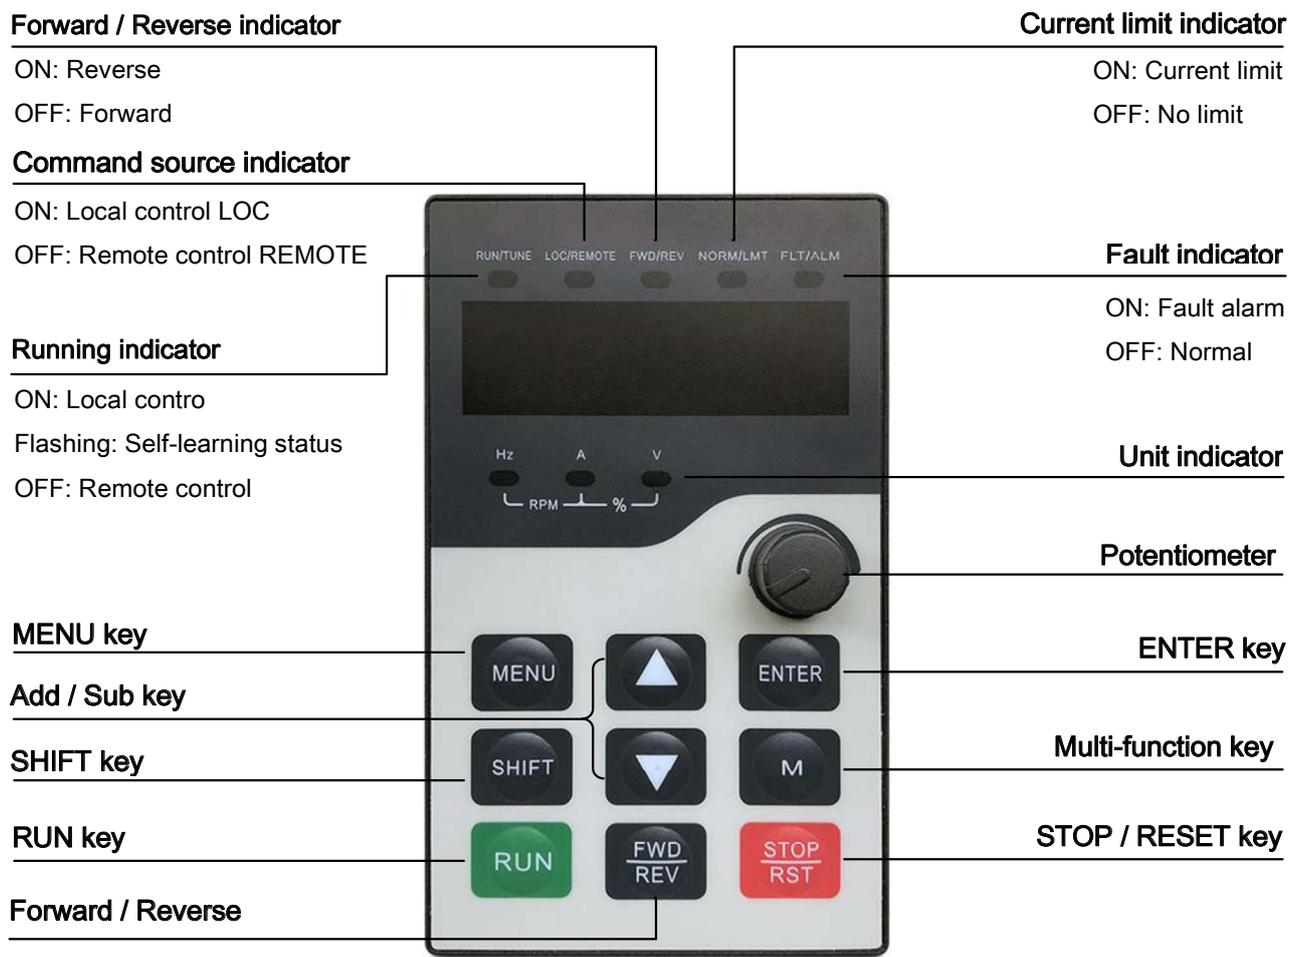

Category	Terminals	Name	Function description	Specification
Multi-function output terminal	Y1	Open collector output terminal (High-speed pulse) output terminal	When defined as Open collector output terminal, refer to the A6.14 for detail, When defined as High-speed pulse output terminal, refer to A6.27 for detail. Maximum frequency could up to 100KHz	Optocoupler isolation output Maximum working voltage.30v Maximum output current.50mA
Power supply	+24V	+24V power supply	Providing +24V power for others	Maximum output current.200mA
Common-port	PLC	Common port of multi-function input	Common port of Multi-function input (Short cut with 24V in default)	Common port of X1 ~ X6, PLC is isolated from 24V internally
	COM	Common port of 24V power supply	Three common ports in all, cooperate with other terminals	COM is isolated from CME and GND inside the drive
Relay output terminal 1	Ra	Relay output	Can be defined as multi-function relay output terminal (Refer to the A6.16 for detail)	Ra-Rb. Normally closed Ra-Rc. normally open Contact capacity . AC250V/2A(COSΦ = 1) AC250V/1A(COSΦ = 0.4) DC30V/1A Input voltage for over-voltage class of relay output terminal is over-voltage class II
	Rb			
	Rc			

Chapter 4 Operation Instructions of Kinco VFD

4.1 Using Operation Panel

4.1.1 Operation panel appearance and keys' function description

Operation panel is used to setup the drive and display parameters, it is LED display. As shown in Fig.4-1

Function indicator:

- RUN/TUNE: When the light is on, it indicates that the inverter is in running state. When the light is flashing, it indicates that the inverter is in the self-learning state. When the light is off, the inverter is in the stop state.
- LOC/REMOTE: Panel operation, terminal operation and communication control indicator.

○ LOCAL/REMOT : Light off	Run/Stop in panel control
● LOCAL/REMOT : Light on	Run/Stop in terminal control
◐ LOCAL/REMOT : Light blink	Run/Stop in communication control

- FWD/REV: Light is on, VFD runs forward; Light is off, VFD runs reversely.
- NORM/LMT : Light is on, VFD is in current limit state; Light is off, VFD is not in current limit state and can run normally.
- FLT/ALM : Fault alarm indicator :

○ LOCAL/REMOT : Light off	VFD in normal running status
● LOCAL/REMOT : Light on	VFD in fault status & display fault code
◐ LOCAL/REMOT : Light blink	VFD in alarm status & do not display fault code

: Unit indicator, used to show unit of current data.

There are some unit below: (○ Light OFF; ● Light ON)

: HZ Frequency unit

: A Current unit

: V Voltage unit

: RPM Speed unit

: % Percentage

There are 8 keys on the operation panel and functions of each key are shown in Table 4-1.

Table 4-1 Function list of operation panel

Key	Name	Function
MENU	Program/exit key	Enter or exit programming status
ENTER	Function/data key	Enter next level menu or confirm data
∧	Increase key	Increase data or parameter
∨	Decrease key	Decrease data or parameter
SHIFT	Shift key	In editing status, press this key to select the Bit to be modified. In other status, this key is used to switch the parameters to display.
M	Multi-function key	Use the b4.01 to configure the function of this key
RUN	Run key	In panel control mode, press this key to run the drive.
STOP/RST	Stop/reset key	Press this key to stop or reset the drive.

4.1.2 Display status of operation panel

FV20 operation panel can display the parameters in stopping, operating, editing and function code..

1. Parameters displayed in stopping status

When the drive is in stop status, the operation panel displays the stop status parameter. Pressing the **SHIFT** key can display different stop status parameters in cycle (Defined by function code b4.05)

2. Parameters displayed in operation status

When the drive receives operating command, it starts running and its panel will display the operation status parameters, the **RUN** indicator turns on. The status of **FWD** indicator depends on the operation direction. The unit indicator display the unit of the parameter, by pressing the **SHIFT** key can display different operation parameters in cycle (Defined by function code b4.05)

3. Parameters displayed in error status

When the drive detects a fault signal, the panel will display the flashing fault code..

Press the **SHIFT** key to display the stop status parameters and error code in cycle. By pressing the **STOP/RST**, control terminal or communication command to reset the error. If the error exists still, then the panel keeps displaying the error code.

4. Parameter edit status

When the drive is in stop, operation or error state, press **MENU/ESC** can enter edit status(If password needed, please refer to description of A0.00).. Edit state displays in 2-level menu, they are function code group or function code number→function code parameter value. You can press **ENTER** to enter parameter displayed status. In function parameter displayed status, press **ENTER** to save the settings, and press **MENU** to exit the menu.

4.1.3 Panel Operation

Various operations can be completed on the operation panel; the following are 5 common

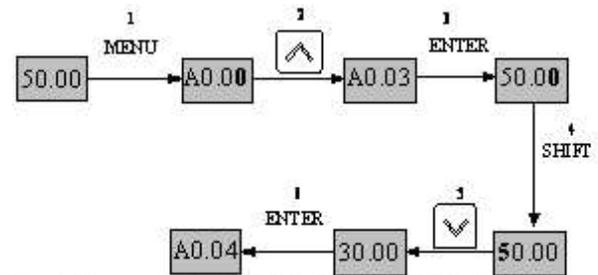

examples. Refer to function code list in chapter 9 for detail function code description.

Example 1.Set parameters

Example.Change the value in A0.03 from 50.00Hz to 30Hz

1. In the stop parameter displaying state, press **MENU** to enter the first level A0.00;
2. Press **▲** to change A0.00 to A0.03;
3. Press **ENTER** to enter the second level menu
4. Press the **SHIFT** to change the marker to the highest bit
5. Press the **▼** to change the 50.00 to 30.00
6. Press the **ENTER** to confirm above change and back to the first level menu. Then the parameter is changed successfully.

The above operations are shown in following picture.

Note: The number in bold font is the flashing bit

Fig 4-2 Example of setting parameter

In function parameter displaying status, if there is no bit flashing. It means that this function code can not be changed, the possible reason are.

1. This function code is unchangeable parameter. Like actual detected parameter, operation log parameter and so on
2. This parameter can not be changed when running; you need stop the VFD to edit the parameter
3. The parameters are protected. When the b4.02 is 1, function code can not be changed. It is to protect the VFD from wrong operation. If you want to edit this parameter, you need set function code b4.02 to 0.

Chapter 5 Troubleshooting

Table 5-1 lists the possible faults of FV20, error code E001 ~ E099. When VFD reports error, users could check this list and record the detailed fault phenomena before seeking service from supplier.

Table 5-1 Faults

Error code	Error category
E001	Hardware over current during acceleration
E002	Hardware over current during deceleration.
E003	Hardware over current during running in constant speed.
E004	Hardware over voltage during acceleration.
E005	Hardware over voltage during deceleration.
E006	Hardware over voltage during running in constant speed.
E007	Software detected over-voltage
E008	Input phase loss
E009	Output phase loss
E010	22kw above models.IGBT module is detected voltage drop too large.
E011	IGBT module's heatsink overheat.
E012	Rectifier's heatsink overheat.
E013	Running current is larger than VFD rated current for long time.
E014	Running current is larger than motor rated current for long time.
E015	External device fault.
E016	EEPROM W/R fault.
E017	VFD can not get communication with host.
E018	Power board/drive board/contactor damage causes contactor abnormal.
E019	Hall/drive board abnormal causes current detective circuit fault.
E020 ~ E022	Reserved
E023	Keyboard parameter copy error
E024	Auto tuning fault in vector control.
E025	Encoder signal fault in lose-loop control
E026	VFD running current is detected smaller than set value of load lost.
E027	Braking unit fault.
E028 ~ E030	Reserved
E031	Current limiting fault
E032	Reserved
E033	VFD output is short circuit to earth
E034	VFD running speed and encoder detected speed deviation exceeds allowed value.
E035 ~ E039	Reserved
E040	Extension card and control board SPI communication fault
E041	Software detected over-current during acceleration
E042	Software detected over-current during deceleration
E043	Software detected over-current at constant speed
E091 ~ E092	Internal data processing is abnormalseek help from manufacturer (MCU communication failed,replace the control board)

Note:

VFD braking resistor short circuit may lead to VFD braking unit damage.

Chapter 6 List of Parameters

FV20 series VFD's parameters are organized in groups. Each group has several parameters that are identified by "Group No.+ Function Code. There are AX,YZ letters in other content in this manual,it indicate the YZ function code in group X.For example,"A6.08" belongs to group A6 and its function code is 8.

The parameter descriptions are listed in the tables below.

Table 6-1 Descriptions of Function Code Parameter Structure Table

No.	Name	Description
1	Function code	The number of function code
2	Name	The name of function code
3	Setting range	The setting range of parameters.
4	Unit	The minimum unit of the setting value of parameters.
5	Factory setting	The setting value of parameters after the product is delivered
6	Modification	<p>The "modification" column in the parameter table means whether the parameter can be modified.</p> <p>" O " : Denotes the parameters can be modified during operation or at STOP state;</p> <p>" x " : Denotes the parameters cannot be modified during operating;</p> <p>" * " : Denotes the parameters are actually detected and cannot be revised;</p> <p>" - " : Denotes the parameters are defaulted by factory and cannot be modified ;</p> <p>(When you try to modify some parameters, the system will check their modification property automatically to avoid mis-modification.)</p>
<p>Note:</p> <p>1 . Parameter settings are expressed in decimal (DEC) and hexadecimal (HEX). If the parameter is expressed in hexadecimal, the bits are independent to each other.The value of the bits can be 0 ~ F.</p> <p>2 . "Factory settings" means the default value of the parameter. When the parameters are initialized, they will resume to the factory settings. But the actual detected or recorded parameters cannot be initialized;</p>		

 Note	It is defaulted that no parameters except A0.03 are allowed changing. If you need change them,please first set b4.02(parameter write-in protection) from 1 to 0.
--	--

Table 6-2 List of Parameters

Function code	Name	Descriptions	Unit	Factory setting	Modif.	Setting range
Group A0.Basic operating parameters						
A0.00	User password	0: No password protection. Others: Password protection.	1	0	O	0 ~ FFFF
A0.01	Control mode	LED Unit's place: Motor 1 control mode 0: Vector control without PG 1: Vector control with PG 2: V/F control without PG 3: V/F control with PG	1	2	X	0 ~ 2

Function code	Name	Descriptions	Unit	Factory setting	Modif.	Setting range
		LED Ten's place: Motor 1 type 0: asynchronous motor 1: synchronous motor LED Hundred's place: Motor 2 control mode 0: Vector control without PG 1: Vector control with PG 2: V/F control without PG 3: V/F control with PG LED Thousand's place: Motor 2 type 0: asynchronous motor 1: synchronous motor
